

ECO TRAY

Now Available for Nationwide Hire

Our ECO TRAYS have been specifically designed to limit environmental damage resulting from concrete washout spillage from both concrete pumps and mixer wagons. Its low-profile design allows the watertight tray to be easily placed under the concrete pump's hopper to collect excess concrete waste and water during washout. They are also a great tool in minimising unnecessary spillages during concrete pours i.e. on roadways, city streets or in environmentally sensitive areas.

The Benefits of Using Our Trays

- **Environmental Benefits**
- **Ease of Use**
- **Contamination Reduction**
- **Concrete Pump Operator Safety**

The Eco Tray is a watertight container designed to minimise concrete washout spillage

It can be easily moved around site by means of the built-in forklift channels or the crane lifting eyes

Its unique tapered sides mean that the hardened concrete will drop freely out of the tray to be then recycled

Their durable steel construction securely pools all contents safely, in order to minimise all potential hazards

As the tray can be placed directly under the concrete pump's hopper, it is a much safer alternative for the operator to wash the machine out compared to washing out over open pits
